Step 4: Implement the Solution (Word Coding)

In step 4, the planned algorithm is translated into a sequence of step-by-step tasks in English. The “word code” clearly outlines the feeding system operation, using meaningful variable names and precise instructions to ensure a clear understanding of the entire process. The system logic is presented in a modular and well-designed sequence, shown below, to ensure consistency and readiness for testing.

```
Start
   Enter the scheduled times
   Enter the amount of food being dispensed each time

While the system is running:
Check current time:
   If time =/ scheduled times
      Check time
Else
   Check the amount of food in the container
   If amount of food < threshold:
      Trigger alert
      Keep the door closed
      Send direct message to the user
   ELSE
      Compare current time with scheduled time
      If current time ≠ scheduled time:
         Keep the door closed
      ELSE
         Open the door and dispense food
         Wait for 20 minutes
         Measure amount of food after feeding
         If amount of food ≥ threshold:
            Count the amount of food left
            Trigger alert
            Send direct message to the user
         ELSE
End
```
