Step 3: Plan the Solution (Design the Algorithm)

In this phase, the algorithm is made to control the operation of the automated pet feeder. Its main tasks are to create clear decision logic to identify when and how the system should dispense food and send alerts to any issues, such as an empty food container or uneaten food, which are to be promptly solved. To ensure the system functions are well-designed before implementation and further testing, the flowchart below visually represents the algorithm.
